

BAB V

KESIMPULAN DAN SARAN

A. Kesimpulan

Dari hasil penelitian yang dilakukan mengenai penggunaan antibiotika pada pasien bedah sesar di RSUD Dr.Moewardi pada tahun 2013, dapat disimpulkan sebagai berikut :

1. Jenis antibiotika yang digunakan ialah ceftriaxone, cefadroxil, metronidazol, amoxicilin dan cefotaxim. jenis antibiotika profilaksis yang paling banyak di gunakan ialah antibiotika golongan sefalosforin generasi ketiga yaitu ceftriaxone tunggal (96,142%), dan (3,82%) kombinasi ceftriaxone-metronidazole dan jenis antibiotika terapi yang paling banyak digunakan ialah golongan sefalosforin generasi pertama yaitu cefadroxil tunggal sebanyak (92,8%) dan kombinasi yaitu metronidazole-cefadroxil sebanyak (6,36%). Rute pemberian secara intravena (IV) untuk profilaksis (100%) dan secara oral untuk terapi (100%). Ditinjau dari dosis dan frekuensi penggunaannya, antibiotika di RSUD Dr.Moewardi telah 100% memenuhi kesesuaian dosis dan frekuensi, dengan lama penggunaan untuk antibiotika profilaksis terbanyak ialah selama 2 hari sebanyak (64,4%) dan terapi selama 3 hari sebanyak (46,7%).
2. Obat yang digunakan di dalam penelitian ini sudah sesuai dengan formularium rumah sakit tahun 2013 dan ASHP *Therapeutic Guidelines* 2013

B. Saran.

1. Diharapkan bagi RSUD Dr.Moewardi Surakata untuk meningkatkan pelayanan medik dan memantau efek samping penggunaan antibiotika pada pasien.
2. Diharapkan adanya penelitian lebih lanjut mengenai penggunaan antibiotika pada pasien bedah sesar berdasarkan perbedaan penggunaan obat pada pasien asuransi dan pasien umum.

Lampiran 2. Perhitungan sampel penelitian

Rumus perhitungan sampel penelitian menggunakan rumus Isaac dan Micheal

$$s = \frac{\lambda^2 \cdot N \cdot P \cdot Q}{d^2(N-1) + \lambda^2 \cdot P \cdot Q}$$

Keterangan:

s = jumlah sampel

λ^2 = dengan dk = 1, taraf kesalahan 1%, 5%, 10%

$P = Q = 0,5$ (50%) merupakan proporsi populasi

$d = 0,05$

N = jumlah populasi (Sugiyono, 2004).

$$\text{sampel 1 tahun} = \frac{3,41 \times 726 \times 0,5 \times 0,5}{0,05^2(726 - 1) + 3,481 \times 0,5 \times 0,5} = 236$$

1 Metronidazole is contraindicated in the first trimester.

2 Avoid near term.

Note: Vaccines in pregnancy—Pregnant women should receive the influenza vaccine. In addition, pregnant women should receive tetanus-diphtheria (Tdap) if not already immune. Live virus vaccines such as measles-mumps-rubella (MMR) and varicella are contraindicated in pregnancy with the exception of yellow fever vaccine. For a listing of vaccines recommended during pregnancy, refer to Table 26 (Adult Immunization).

(Table continued on following page)

TABLE 23 Antimicrobials in Pregnancy

Definitions of Pregnancy Category (continued)

- Category A: Controlled studies in women fail to demonstrate a risk to the fetus in the first trimester, and there is no evidence of a risk in later trimesters. The possibility of fetal harm appears remote.
- Category B: Either animal-reproduction studies have not demonstrated a fetal risk, but there are no controlled studies in pregnant women; or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the first trimester (and there is no evidence of a risk in later trimesters).
- Category C: Either studies in animals have revealed adverse effects on the fetus (embryogenic, teratogenic, or other), and there are no controlled studies in women; or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the fetus.
- Category D: There is positive evidence of human fetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (eg, the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
- Category X: Studies in animals or human beings have demonstrated fetal abnormalities, there is evidence of fetal risk based on human experience, or both; and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.

TABLE 24 Antimicrobials in Lactation

Most antimicrobials are **compatible** with lactation and are safe to the nursing infant with a few exceptions that are listed in the following table. It is, however, prudent to minimize maternal exposure to all medications.

Antimicrobials Contraindicated in Lactation

Antimicrobial Name (Generic)	Notes
Chloramphenicol	Potential for idiosyncratic bone marrow suppression
Ciprofloxacin, norfloxacin (quinolones)	Ciprofloxacin is not currently approved for children. Cartilage lesions and arthropathies were seen in immature animals
Clofazimine	Clofazimine is excreted into breast milk and may result in skin pigmentation of the nursing infant
Furazolidone	Avoid in infants less than 1 month old due to potential risk of hemolytic anemia
Metronidazole	Risk of mutagenicity and carcinogenicity. American Academy of Pediatrics recommends discontinuing breast feeding for 12 to 24 hours to allow drug excretion
Vaccines	Vaccines are compatible with lactation, including live vaccines such as measles-mumps-rubella (MMR) and oral polio vaccine (OPV). There has been transfer of live vaccines to nursing infants with no ill effects noted
