

BAB V

KESIMPULAN DAN SARAN

A. Kesimpulan

1. Kombinasi *crospovidone* sebagai *superdisintegrant* dan *cellactose*[®] sebagai *filler-binder* berpengaruh terhadap sifat fisik sediaan FDT metoklopramid HCl yaitu kekerasan, kerapuhan, waktu hancur, dan disolusi obat. *Crospovidone* meningkatkan kekerasan dan waktu hancur *in vitro* dan *in vivo*, sedangkan *cellactose*[®] meningkatkan laju alir serbuk sediaan FDT metoklopramid HCl.
2. Konsentrasi *crospovidone* 7% (10,5 mg) dan *cellactose*[®] 53% (79,5 mg) pada sediaan FDT metoklopramid HCl memberikan sifat fisik tablet dan pelepasan obat yang optimum.

B. Saran

1. Perlu dilakukan penelitian lebih lanjut sediaan FDT metoklopramid HCl dengan dilakukan kompleks inklusi zat aktif untuk memberikan rasa tablet lebih nyaman di mulut.
2. Perlu dilakukan penelitian lebih lanjut dengan menggunakan metode lain seperti *moulding* yang dapat memperbaiki mutu fisik tablet.

⁽¹⁾ Inference for linear mixtures uses Type I sums of squares.

Mixture Component coding is **L_Pseudo**.
Sum of squares is **Type III - Partial**.

The **Model F-value** of 35.24 implies the model is significant. There is only a 0.05% chance that an F-value this large could occur due to noise.

P-values less than 0.0500 indicate model terms are significant. In this case A, B, AB are significant model terms. Values greater than 0.1000

Lampiran 10. Kurva baku dan validasi metode analisis

a. Pembuatan larutan baku metoklopramid HCl

Larutan baku 113 ppm dibuat dengan menimbang sebanyak 11,3 mg dan dimasukkan dalam labu tentukur 100 mL ditambah aquadestillata sampai tanda batas.

- Perhitungan bahan :

Kertas kosong : 0,5695 gram

Zat aktif : 0,01 gram

Kertas + zat aktif : 0,5814 gram

Sisa pada kertas : 0,5701

Zat aktif = (kertas + zat aktif) – (sisa pada kertas)

= 0,5814 – 0,5701

= 0,0113 gram

= 11,3 mg/100 mL

= 113 ppm

b. Panjang gelombang maksimum

Panjang gelombang maksimum diperoleh dari *scanning* larutan baku metoklopramid HCl konsentrasi 113 ppm dengan panjang gelombang maksimum sebesar 273 nm absorbansi 0,3698 dalam pelarut aquadestillata.

c. *Operating time*

Scanning operating time menunjukkan bahwa larutan baku dengan konsentrasi 113 ppm stabil, nilai serapan stabil dari menit ke-0 hingga menit ke-30.
